

# From Coffeeshop to Restaurant: Maximizing One's Amsterdam Experience

Coursera & IBM Applied Capstone Project

Hanna Kondrashova  
May 25, 2019

# Introduction and Problem Motivation

- Amsterdam, the capital of the Netherlands, is well-known for its **coffeeshop culture**, one of the greatest tourist attractions from all over the world.
- Marijuana consumption in a coffeeshop makes one hungry and requires going to a restaurant.
- This research is a short and simple guide on where to **smoke and eat** in Amsterdam based on Forsquare likes, restaurant category and geographical location data.
- We will also **cluster** all the restaurants of Amsterdam by their proximity to coffeeshops so that our user could easily determine what is the best duo of places of their interest.
- **This research is for:**
  1. **Tourists** planning their first experience as described above.
  2. Accomplished Amsterdam **visitors** or even locals looking for new ideas for their following from-coffeeshop-to-restaurant tour.
  3. **Tourists or locals** that, on the contrary, want to avoid dining at a place close to a coffeeshop.
  4. **Potential restaurant owners** that consider location proximity of their food venue to a coffeeshop as one of the important success factors.

# Data Acquisition and Cleaning

- Foursquare API to pull the following location data on restaurants and coffeeshops in Amsterdam.
- .csv file with geographical and statistical data about all the neighbourhoods of Amsterdam from an official government website

Data came almost clean but have some extra columns which we kept.

	subject	region_name	regio_type	region_code	ninhabitants	nmen	nwomen	nage_0_to_15	nage_15_to_25	n
1	Burgwallen-Oude Zijde	Amsterdam	Wijk	WK036300	4280	2340	1935	255	675	2
2	Kop Zeedijk	Amsterdam	Buurt	BU03630000	1020	570	445	50	140	5
3	Oude Kerk e.o.	Amsterdam	Buurt	BU03630001	670	365	300	30	130	3
4	Burgwallen Oost	Amsterdam	Buurt	BU03630002	1610	880	730	120	250	7
5	Nes e.o.	Amsterdam	Buurt	BU03630003	370	185	180	25	70	1

# Methodology

The geograpical coordinate of Amsterdam, Nederland 52.3745403, 4.89797550561798.

We grouped our neighbourhoods into 10 clusters by their lat and lon.

```
# group neighbourhoods by coordinates
n_clusters = 10
neighbourhoods_grouped = KMeans(n_clusters=n_clusters, random_state=0).fit(df_data_1[['lat', 'lon']])
neighbourhoods_grouped.cluster_centers_

array([[ 52.35418413,  4.8981259 ],
       [ 52.3656447 ,  4.99573439],
       [ 52.35477417,  4.81402566],
       [ 52.35873673,  4.93480968],
       [ 52.35146221,  4.86206048],
       [ 52.3084988 ,  4.97114465],
       [ 52.39572502,  4.93289053],
       [ 52.37687063,  4.84651167],
       [ 52.37696239,  4.78780509],
       [ 52.38700674,  4.88262484]])
```

- 74 of 188 restaurants were unique
- 20 of the top 30 coffeeshops/venues had > 5 restaurants nearby.
- Out of 42 unique restaurant categories, top-10 with the highest score were:

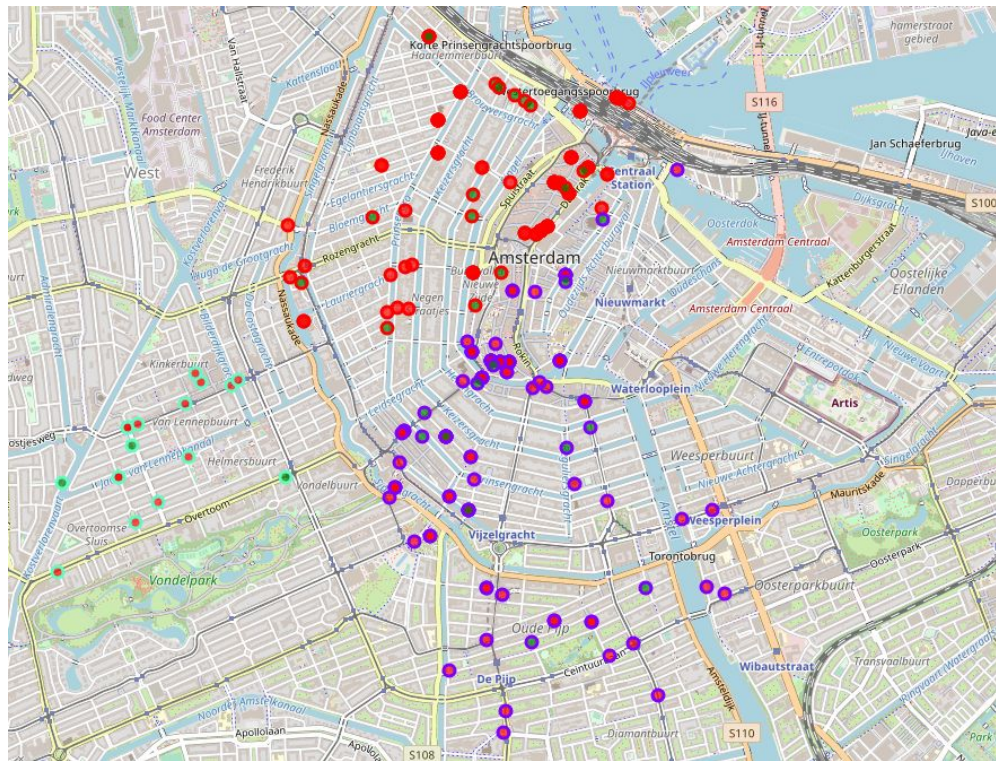

```
category
Dessert Shops      9.4
Pizza Places       9.2
Cocktail Bars      9.2
Diners             9.1
Food Courts        9.1
French Restaurants 9.1
Caribbean Restaurants 9.1
Seafood Restaurants 9.1
Moroccan Restaurants 9.0
Steakhouses        9.0
Name: score, dtype: float64
```

# Visualization with Folium

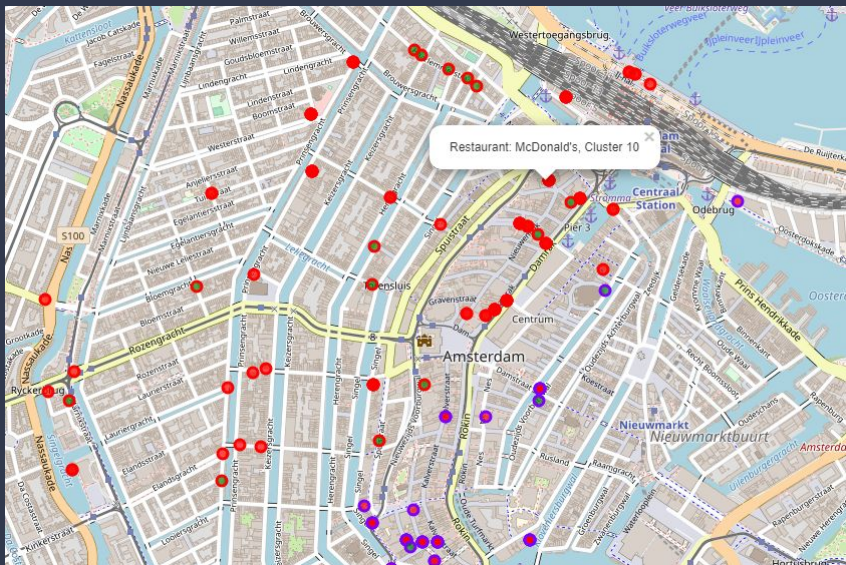

Map of clustered Amsterdam neighbourhoods

Neighbourhoods + coffeshops + restaurants

# Visualization

Closer look at "Neighbourhoods + coffeeshops +  
restaurants"

Restaurants by their number and score in relevant clusters:

Top-venues/coffeeshops by their number and score:

# Results

- Top-level restaurants in **the center of Amsterdam** are located nearby (within 500m) top-rated from coffeeshops.
- Neighbourhood clusters which have the biggest number of said top venues are **1, 5 and 10**, which are, as expected, located close to Amsterdam Centraal railway station, popular tourist attractions and so on.
- The **further** from the center, the **less** coffeeshops with enough good restaurants around them we observe.
- If a visitor of the city seeks this specific kind of experience with maximal proximity and minimal commute, it is strongly advised for him or her to choose one of the neighbourhoods from the clusters **1, 5 or 10**.

# Discussion

- **Top-30** coffeeshops of Amsterdam belong to **three** neighbourhoods clusters
- It might be **economically beneficial** to widen the geography of said venues by creating new or moving old ones to different neighbourhoods.
- Such an action would make it possible to attract more tourists to **other areas** located out of historical centrum of the city, as it is currently an outspoken priority of the local government due to enormous overcrowding.

# Conclusion and Future Directions

- Amsterdam is a capital of top coffeeshops and excellent food venues, but there's **extreme centralization** of tourist attractions, which causes huge problems with housing, congestion, unemployment, air pollution, social problems and energy tension.
- While our research is focused on **Food Venues** only, other possible categories can also be used for the same implementation (e.g. proximity to coffeeshops) such as Nightlife, Hotels etc.
- We have chosen to limit the scope of our research due to **Foursquare API** daily limit of free user queries.
- The **accuracy** depends on the data provided by FourSquare.
